16 October 2026

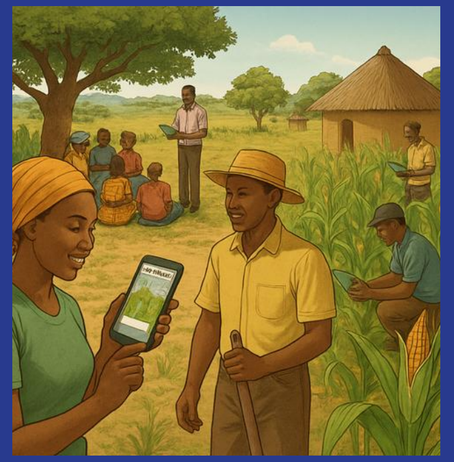

# Chengeta / Londoloza: Chengeta (Shona) and Londoloza (Ndebele): to keep safe

Distribution, pricing and claims built on a national service platform that already reaches the people insurers Cannot.

ICZ Innovation Challenge

Decision Edge Consulting

# Muyamuri / Umsizi · The Insurance Module

The distribution, pricing and claims platform for Zimbabwe’s next insurance decade, now selling, pricing and settling end to end.

Tichavona Vakisai
Business Development Manager

DecisionEdge CONSULTING

# Our Discussion Today

- The Challenges: Problems nobody has solved together.
- Opportunities: What Muyamuri/Umsizi already carries.
- Platform Insurer Inherits - An Integrated solution rather than build.
- Customer Journey: Multi channel support fostering inclusion.
- Consent and Data Quality – Governance is the product.
- Business Model and Investment Conversations.

# Two problems, and nobody has solved them together

Insurers cannot price what they cannot see, and cannot reach the people who most need cover. Each problem makes the other worse.

**2.0 → 6.0%**
Insurance penetration, against 6% globally average - the addressable headroom

**88%**
Of the short-term book is compulsory motor

**76%**
Of GDP is informal and almost entirely uncovered

**95%**
Mobile penetration across the country

**769,625**
short-term policies at 31 March 2026: The base this platform sells into

### PROBLEM ONE · PRICING

No perils database, no claims bureau, no address-level risk data, no hazard map, no crop record. Every quote carries a loading for uncertainty, and that loading is what stops voluntary cover selling. Strip out compulsory motor and the market barely trades.

### PROBLEM TWO · REACH

Distribution is a branch, a broker and a paper form. No branch network reaches a gold panner in Kadoma or a smallholder in Gokwe. Broker economics do not work on a $3 premium. So the voluntary market is 12% of policies, and the informal 76% of the economy is served by funeral societies and nothing else.

Every attempt so far has picked one. A digital broker solves reach and still prices blind. A data vendor sells a risk score to insurers who have no way to reach the customer it describes. The two problems are the same problem, and solving them needs something neither an insurer nor an insurtech would ever build: a national civic platform that people use for reasons that have nothing to do with insurance.

*Market figures: IPEC Q1 2026 short-term returns and 2024 Annual Report; IPEC statements on microinsurance and financial inclusion, 2025–2026. 591 service description from ICZ published material.*

THE ASSET

# Muyamuri / Umsizi already carries both halves

A national civic platform in daily use for ten services that have nothing to do with insurance. Each one describes a population, a place or an asset as a by-product of doing its actual job.

**Emergency reporting**
Incident type, place, time, outcome

**Roadside assistance**
Breakdown cause, location, recovery

**Government inquiries**
LLM based RAG to retrieve and answer based on official documents

**Municipal services**
Water, refuse, faults by suburb

**Agriculture Extension**
Field boundaries, rainfall, seasons, Pest and Disease Prevalence

**Mining regularisation**
Claim boundaries, workings, crews

**Facility directory**
Clinics, police, fire, workshops

**Public notices**
Authority-to-citizen broadcast

**Nzira / Indlela**
Hazard-aware navigation

**Consular Service**
Diaspora help with consulate services and engagements

**Insurance is a second use of data collected for a first purpose:** - which is exactly why it has provenance. Nobody filed a hazard report to get a cheaper premium.

One citizen identity, one consent record, ten services

# Five channels, each doing the job it is best at

This is not a WhatsApp product. WhatsApp is the inclusion rail, the channel that reaches a feature phone with no data bundle and no app store account, the informal market and it is one of five.

1

## WhatsApp

*The inclusion rail*

Quote, compare, buy, upload KYC, pay, claim. Shona, Ndebele and English. Interactive menus, not free text.

Reaches everyone

2

## USSD

*Below the smartphone line*

No smartphone, no internet. Balance, renewal, resume a purchase. The PIN prompt that confirms payment arrives here.

Works on any handset

3

## Mobile app

*Where evidence matters*

Photographic claims, document wallet, policy library, map-based incident reporting, Nzira navigation.

Rich interaction

4

## Insurer portal

*The desk side*

Underwriting desk, claims queue, rating audit trail, document reveal — scoped to one insurer by RBAC.

The partner's workspace

5

## Partner API

*No manual recapture*

Versioned REST. An insurer keeps its own core system and consumes quotes, policies and claims as events.

No migration required

**One policy record, five ways in.** A gold panner buys over WhatsApp, confirms with a USSD PIN, photographs the damage in the app and the insurer sees one claim on one desk. The customer never knows there were five systems.

# Populations insurers have never had an interface to

Not demographic segments drawn on a whiteboard. These are groups the platform is already describing, module by module, because each one came to it for a civic service first.

| Population | Why they are uninsured today | What the platform already knows | Cover it unlocks |
|---|---|---|---|
| Artisanal miners | No address, no claims history, treated as uninsurable by class | Claim boundary walked on foot, workings, crew size, incident record | Personal accident, equipment, liability |
| Smallholder farmers | Loss assessment on a 15 ha plot costs more than the premium | Field boundary, hectares, crop, seasonal rainfall at the field | Index drought and excess-rain cover |
| Motorists | 88% hold compulsory motor only: - nothing voluntary attaches to it | Routes driven, hazards reported, breakdown and callout history | Roadside, excess, upgraded motor |
| Informal households | Premiums priced for a formal suburb they do not live in | Suburb-level incident and service record, construction, security | Micro funeral, household contents |
| Diaspora senders | Remit cash for emergencies with no product wrapping the risk | The dependent household is already on the platform | Funeral and medical cover paid from abroad |

**Each row is a segment of unknown size with no claims history and no address: - until a module built for something else started describing it.**
**The diaspora row is the one an insurer usually has not costed: hard currency premium, local currency claim**

WORKED EXAMPLE

# How a mine-regularisation module creates an insurable class

1 **A syndicate registers to regularise**

Their reason is a mining title, not a policy. Insurance is not mentioned.

2 **They walk the boundary with the app**

GPS trace becomes hectares, perimeter and a centroid, a geometry, not a described place.

3 **Workings and crew are recorded**

Shaft depth, method, how many people underground on a shift.

4 **Incidents accrue through emergency reporting**

Collapses, injuries and callouts at that geometry, over time, from the module next door.

**WHAT AN UNDERWRITER NOW HAS**

- A located, measured risk with a stable identifier
- Exposure count: - people per shift, not a guess
- An incident history at that exact site
- A peer group: comparable workings in the district
- A channel to the insured that already works

---

**ASM personal accident becomes quotable:- not because an actuary got braver, but because the class finally has a description.**

The same pattern runs for Agromate and fields, municipal services and suburbs, hazard reports and roads

WHAT COMES FREE

# Platform services an insurer inherits rather than builds

## Nzira / Indlela

Hazard-aware navigation routes a driver around a corroborated hazard. Fewer incidents on insured journeys, loss prevention, not loss measurement.

It watches the road, not the driver

## Reporter credibility scoring

Built to stop false emergency callouts. The same score is a fraud signal on a claim from the same identity.

Years of behaviour, already accrued

## Multi-responder dispatch

Police, ambulance, fire, tow and council notified in parallel, with status tracked to resolution.

A claim's first notification, handled

## GIS and notices

Geometry, mapping and authority-to-citizen broadcast:- the renewal and catastrophe-warning rail.

Infrastructure, not a feature

None of this is on an insurance company's roadmap, and none of it would survive a business case inside one. It is running in the platform because each piece was necessary for a civic service and insurance is downstream of all of it.

---

Roadside assistance already runs as a dispatch service on this platform. The incumbent comparison is ICZ's 591:- a phone line with no policy record, no geometry and no claims link behind it.

A competing insurtech would have to build a civic platform first, win the authority relationships, and wait years for the behavioural history to accrue.

Loss prevention, fraud signal, first notification of loss, catastrophe comms:- all pre-existing in the design concept of the system

THE MODULE, TODAY

# A policy can now be sold, paid for and bound without leaving the chat

**STEP 1**

### Choose a product

Nine covers in an interactive menu, the same order as the app. Then sum insured, name, and only the risk questions that product actually prices on.

**STEP 2**

### Compare the panel

Nine insurers quote the same risk. The citizen sees the spread and asks *why 3* to get that insurer's own rating breakdown, factor by factor.

**STEP 3**

### KYC in the thread

ID number, then photographs of the documents the chosen insurer requires at that sum insured. Encrypted on arrival, before they touch disk.

**STEP 4**

### Pay by USSD PIN

EcoCash pushes a prompt to the handset. The citizen enters their PIN on their own phone, no card, no card number in the chat.

**STEP 5**

### Bound, or resumable

Settled payment binds the policy. An unanswered PIN asks *now or later*, then parks the purchase, resumable on any channel.

**PAYMENT DISCIPLINE**

Pay first, bind second. Three charge attempts maximum, a 90-second PIN window, and at least 20 hours between reminder prompts so a hesitant buyer is never harassed.

**KYC BY INSURER**

Each partner sets its own policy and document threshold: simplified verification below it, full documentary KYC above. An unrecognised partner defaults to full.

**DOCUMENTS AT REST**

AES-256-GCM per file, verified before the write, a file that fails the check is refused, not stored. No bulk decrypt endpoint exists, by design.

The purchase services are built and tested against a controllable clock · the chat wiring is in progress

UNDERWRITING DISCIPLINE

# Every cover prices on its own factors, and only its own

A rating profile per cover declares which factors apply, the ceiling for automatic acceptance, and the sentence the customer is shown about what the price was based on. A factor that is not on the profile is never requested, never queried and never loaded.

| Cover | Factors that apply |
|---|---|
| Micro funeral | Age band and sum insured only |
| Micro personal accident | Occupation class and sum insured only |
| ASM personal accident | Exposure count and workings class |
| Household contents | Construction, security, claims, area |
| Index drought / excess rain | Seasonal rainfall at the insured field |

A funeral quote no longer asks about construction, and no longer calls the risk service at all.

## FOUR RULES BEHIND IT

### Unanswered is neutral, never worst

A missing answer prices at 1.0. It used to default to the heaviest loading, which quietly punished people for a question the flow never asked.

### Referral thresholds are per cover

A $2,000 funeral sum and a $2,000 household sum are not the same underwriting decision.

### An unknown cover throws

It no longer falls back to a default rate. A cover with no profile cannot be priced at all.

### The disclosure matches the arithmetic

Ask *why 3* and the breakdown lists the factors actually applied, nothing else, and nothing omitted.

Verified by an audit that prices every factor against all thirteen covers, and asserts that the risk service is never called where no area factor exists. **The rating trace is persisted as issued** - defensible to IPEC, to a reinsurer and to the customer.

Nine insurers on the panel · rate factors spanning 0.92 to 1.18 · five with data entitlement

PARAMETRIC COVER

# Index cover priced on the platform's own rainfall record

Agromate holds field boundaries, seasonal rainfall and forecasts because farmers use it to decide when to plant. That is the same series an index product needs to set a trigger — which makes parametric cover possible here without buying a third-party weather index.

### A trigger at the field

Cumulative rainfall over the growing window at that boundary, against a threshold. Stepped payouts, so a marginal season pays something rather than nothing.

### Credibility, not confidence

Observed trigger frequency is blended with the rate table's assumption in proportion to seasons available, full weight at thirty, partial below that.

### A floor on the history

Below ten seasons the signal does not price at all. The quote falls back to base rates and says on its face that it did.

### Bounded either way

Loading capped at +50%, discount at -30%. A sparse or freak series cannot swing a premium to an indefensible number.

No loss assessor ever visits a 1.5-hectare plot. **The trigger is observable, the payout is arithmetic, and the dispute surface is close to zero** - which is the only way the economics of smallholder cover have ever worked anywhere.

---

Honest caveat: Agromate utilises remote sensing technology and is integrated to ZimStats2 which gives it up to 10 years historic seasonal archive giving insurer instant access to this data over live endpoint once commercial agreement exist.

Partial credibility is standard actuarial practice, the novelty is having a first-party series to apply it to

CLAIMS

# The incident is on the desk before the customer files

A policyholder in a collision reports it as an emergency, because that is the urgent thing. Dispatch goes out. The report carries a type, a place, a time, an outcome and a reporter whose credibility is already scored. When a claim arrives against the same policy, that record is sitting next to it.

**Corroborated**: an independent civic report matches the claim in type, place and time

**No matching record**: not evidence of fraud. Most losses are never reported to anyone

**Contradicted**: a record exists and disagrees. This one goes to a human assessor

Three states, deliberately. A binary flag would turn an absent record into an accusation, and most honest claims have no record behind them.

## WHAT THE DESK GETS

### First notification without a call centre

The dispatch record is the FNOL. Roadside and emergency callouts already flow through it.

### Photographs from the scene

Timestamped and located, taken on the same thread the policy was bought on.

### A credibility history, not a score invented today

Accrued over years of unrelated civic reporting by that identity.

### One queue, scoped to one insurer

Claims, documents and the rating trace that produced the premium, in one place.

Faster settlement for the honest claimant is the same mechanism as earlier detection of the dishonest one

GOVERNANCE

# Two routes to a risk signal, and the discipline is the product

ROUTE 1 · NEEDS NO AGREEMENT

## The applicant's own data, with their consent

Their field boundary, their mining claim, their callout history, their reports. First-party data, consented at the point of quotation, usable on day one.

Live now. No MOU, no authority signature, no waiting.

ROUTE 2 · BEHIND AN ENTITLEMENT GATE

## Aggregate area signals, never anybody's record

Incident density in a 500m cell, released only where the cell holds at least fifteen reports from five distinct reporters. Banded, never a raw number. Per-insurer entitlement, per-call audit.

Five of nine partners entitled. The long pole is the MOU, not the code.

### Nobody's report prices their own premium

Reporting a hazard can never make your own cover more expensive. If it could, people would stop reporting and the civic platform would die to feed the insurance one.

### A signal that is absent says so

An unentitled insurer, a thin cell or a failed call all produce a clean base-rate quote that discloses it was priced on base rates, never a silent substitution.

### Encrypted, with no bulk door

Documents and identity numbers encrypted at rest with AES-256-GCM, TLS in transit, reveal one record at a time to the insurer desk and platform admin. There is no bulk decrypt endpoint and there will not be.

Route 1 compounds from the first policy · Route 2 switches on per insurer as agreements land

INTEGRATION AND BUSINESS MODEL

# How an insurer connects, and how the platform earns

## ONBOARDING AN INSURER

**Keep your core system.** Versioned REST API — quotes, policies, claims and payments as events. No migration, no replacement.

**Set your own appetite.** Your rate factor, your KYC threshold, your referral limits. Joining the panel is not accepting someone else's risk view.

**See only your own book.** An insurer desk scoped by RBAC to that insurer's quotes, policies, claims and documents.

**Never blocks, never fails visibly.** A hard ceiling on every external call; any failure degrades to a disclosed base-rate quote.

NestJS on TypeScript · TypeORM against SQL Server · containerised · full rating trace persisted as issued

## WHERE REVENUE COMES FROM

| Line | Who pays |
|---|---|
| Commission on premium | Insurers, on policies the platform distributes |
| Data entitlement licence | Insurers, for Route 2 area signals under MOU |
| Platform licence | Municipalities and authorities, for the civic modules |
| Roadside subscription | Motorists, direct or bundled with a motor policy |
| Dispatch and SLA fees | Service providers on the responder network |

**The loop that matters:** insurer and authority licence fees fund the citizen services, which stay free. Free services bring the usage that produces the data, and the data is what makes the pricing worth licensing.

Insurer tenancy rails in place, wiring in progress:- access is by seniority today. Named in full on the next slide.

WHERE WE HONESTLY ARE

# Built, not built, and the order we close the gap in

## RUNNING TODAY

- Ten civic modules in daily use across five channels
- Nine covers quoting, nine insurers comparing on one risk
- Per-cover rating with the trace persisted as issued
- Purchase, tiered KYC, encrypted documents, USSD PIN payment, resumable state
- Route 1 first-party signals and the Route 2 entitlement gate
- Index cover with partial credibility and a seasons floor

## NOT BUILT, AND SAID BEFORE YOU FIND IT

- **No live users and no written premium.** Every figure here is seeded demonstration data
- **No loss ratio and no back-test** of the rating model against real claims
- **Insurer tenancy.** The insurer code is on every row; the scoping predicate is not yet applied
- **The purchase chat wiring** is in progress; the services beneath it are the tested part
- **Route-risk paging** reads a bounded slice of callouts per query

### Phase 1 · months 1–4 · prove the pricing

Back-test against a sponsor's claims history. Close tenancy and the archive check. Pilot on micro and funeral.

Gate: the model holds against real losses

### Phase 2 · months 5–8 · intelligence live

Authority agreements land; area pricing switches on per entitled insurer. Route 1 compounds throughout regardless.

The long pole is the MOU, not the code

### Phase 3 · months 9–12 · national

Open the panel wider, take Nzira to every road user, extend index cover across the smallholder footprint.

Gate: unit economics proven per policy

Phase 1 writes no policy on an unvalidated model. **A pricing edge that has not been tested against an insurer's own losses is a hypothesis**, and selling on a hypothesis is how a book goes wrong quietly.

None of this is hidden in the product either: a quote priced without a signal says so on its face

IMPACT AND THE ASK

# From a working platform to the distribution and pricing layer of record

### Cover reaches the uncovered

Because the channel already reaches them, not because anyone built a branch

Test: policies on feature phones

### Premiums fall for good risks

Because a described risk no longer has to be priced for the worst case in its class

Test: spread across the panel

### Fewer losses occur at all

Because hazard-aware navigation routes drivers around the hazard

Test: incident rate on routed journeys

### Claims settle faster

Because the corroborating record arrived before the claim did

Test: days to settle, corroborated vs not

## From an underwriting partner

- A named sponsor for Phase 1
- **24 months of claims data under NDA**, to validate the pricing before go-live
- Your rate factor and KYC threshold, so the panel reflects your appetite
- Authority introductions where relationships already exist and a conversation about roadside

## From an investment partner

- Growth capital for the Phase 2–3 build-out and national rollout
- A seat on product and market-expansion decisions
- A platform positioned to hold this layer before anyone else can assemble it

The two hardest things to build in this market:- a compliant national data layer and a distribution channel the informal sector will actually use. Both are already built. A competitor starting today starts years behind on both, and cannot shorten the wait with capital.
